

March 2010

Dr. Sacco is a coauthor for a paper titled:

"A multicenter investigation of OPTI-FREE RepleniSH multi-purpose disinfecting solution impact on soft contact lens patient comfort"

The article appears in this month's issue of *Clinical Ophthalmology*. The results of the paper and research show that contact lens disinfecting solution has a direct effect on patient comfort and wearability. In many cases, even in successful contact lens wearers, changing contact lens solution may improve wearing comfort and the overall wearing experience. This has certainly been our experience in our practice, and is why we prescribe specific care systems for our contact lens patients. The results of this paper again reinforce the need for a specific lens care regimen to maximize patient comfort.
